

# [cms] Possibility of having 2 urls to a single page [5.3.0-B1]

Imported From: [http://groups.google.com/group/in-portal-bugs/browse\\_thread/thread/fcfa934440a88879#](http://groups.google.com/group/in-portal-bugs/browse_thread/thread/fcfa934440a88879#)

In [Incorrect section/category physical template detection](#) discussion I've talked about physical and virtual sections and fact, that 2 urls exists to a single physical section.

At first this might not seem a big problem, especially if across a theme "use\_section" parameter of m\_Link tag is used, which forces url from "Structure & Data" section to be used. However if user manually guesses url to a TPL file, which is behind "Structure & Data" section url, then page will be shown too.

If google spider guess that url, then website could be banned because 2 different urls result in showing same page at all times.

I propose to automatically redirect (with 301 Moved Permanently http code) visitor to page url equivalent from "Structure & Data" section and put a notice into "System Log". This way developers would know that somebody still accesses old page url. And using HTTP\_REFERER header they would know exactly who that might be.
