

Ability to use PerPage, SortBy and Page params from URL Query

Imported From: http://groups.google.com/group/in-portal-dev/browse_thread/thread/c722936e20596265#

We are looking for a way to extend functionality for using PerPage, SortBy and Page params from URL Query. Here is a quick outline of things to do:

New Query Params Usage:

1. Tag PageLink will include parameters "page,per_page,sort_by" from request, when available (only pass them, when differ, from default values from unit config of that prefix)
2. Pass main_list="1" to InitList/PrintList of main list on the page (one list per page)
3. When main_list parameter is given, then during list initialization use page,per_page,sort_by from url to initialize list
4. Remove "action" attribute from <form> tags on front-end
5. Events OnSetPage, OnSetPerPage, OnSetSorting* should not add associated with them url parameter (page,per_page,sort_by), when it's value is equals to default value from unit config of main list being used.

New Query Params Storage:

1. don't store page,page,sorting in session on Front-End (setting in debug.php)
2. store page,page,sorting in cookie (expiration until browser is closed) in format "<prefix>_var", e.g. "product_page".
