

[emails] Multi-recipient e-mail has broken recipient names [5.x]

Imported from: http://groups.google.com/group/in-portal-bugs/browse_thread/thread/f880fac783d3a164#

When In-Portal sends out e-mails it encodes sender and recipients e-mail addresses using Quoted-Printable as algorithm and utf-8 as charset.

Encoding is right, but when you need to send e-mail to 2 (or more) e-mails together then code, that connects them into 1 recipient string cuts of first 2 symbols of encoded line resulting in e-mail client not being able to properly decode it.

`multi_recipient_email_has_broken_recipient_names.patch`
